L4: Entry 9 of 20

File: USPT

Dec 1, 1998

DOCUMENT-IDENTIFIER: US 5843884 A

TITLE: C9 complement inhibitor

BSPR:

The classic complement pathway involves an initial antibody recognition of, and binding to, an antigenic site (SA) on a target cell. This surface bound antibody subsequently reacts with the first component of complement, C1q, forming a C1-antibody complex with Ca ++, C1r, and C1s which is proteolytically active. C1s cleaves C2 and C4 into active components, C2a and C4a. The C4b, 2a complex is an active protease called C3 convertase, and acts to cleave C3 into C3a and C3b. C3b forms a complex with C4b, 2a to produce C4b, 2a, 3b, which cleaves C5 into C5a and C5b. C5b combines with C6. The C5b, 6 complex combines with C7 to form the ternary complex C5b, 6, 7. The C5b, 6, 7 complex binds C8 at the surface of the cell, which may develop functional membrane lesions and undergo slow lysis. Upon binding of C9 to the C8 molecules in the C5b, 6, 7, 8 complex, lysis of bacteria and other foreign cells is rapidly accelerated.

Jul 22, 1997

DOCUMENT-IDENTIFIER: US 5650389 A

TITLE: Methods for the inhibition of complement activation

BSPR:

The complement system can be activated via two pathways, an antibody-dependent pathway called the classical pathway and an antibody-independent pathway called the alternative pathway (1,2). Activation of either pathway results in the assembly of enzymes called C3 convertases which cleave complement component C3 at a single peptide bond to form C3a and C3b. Some of the C3b molecules then bind to the C3 convertases changing their substrate specificity such that they now cleave C5 to C5a and C5b. All of the biological activities of the complement system, in turn, are derived from the cleavage products of C3 and C5.

DEPR:

The complement system can be activated via two pathways, an antibody-dependent pathway called the classical pathway and an antibody-independent pathway called the alternative pathway (1,2). Activation of either pathway results in the assembly of enzymes called C3 convertases which cleave complement component C3 at a single peptide bond to form C3a and C3b. Some of the C3b molecules then bind to the C3 convertases changing their substrate specificity such that they now cleave C5 to C5a and C5b.
